
Power BI: Nele's Café

Project Overview

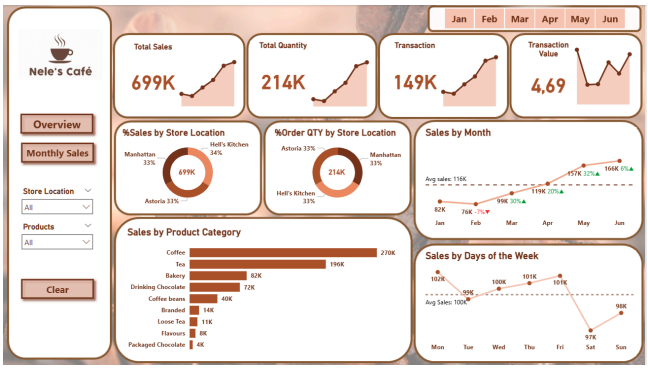
The aim of the project was to analyse the Performance of a fictional coffee shop, “Nele’s Café”, using a dataset from Maven Analytics. The objective was to create an interactive dashboard in Power BI to display key business metrics and gather actionable insights.

Key Business Questions

The Power BI dashboard was built to answer the following key business questions:

- How are sales performing over time?
- Which stores are performing best?
- What products drive the most revenue?
- When do customers buy the most (time and day patterns)?

Dashboard Analysis



3.1. How are sales performing over time?

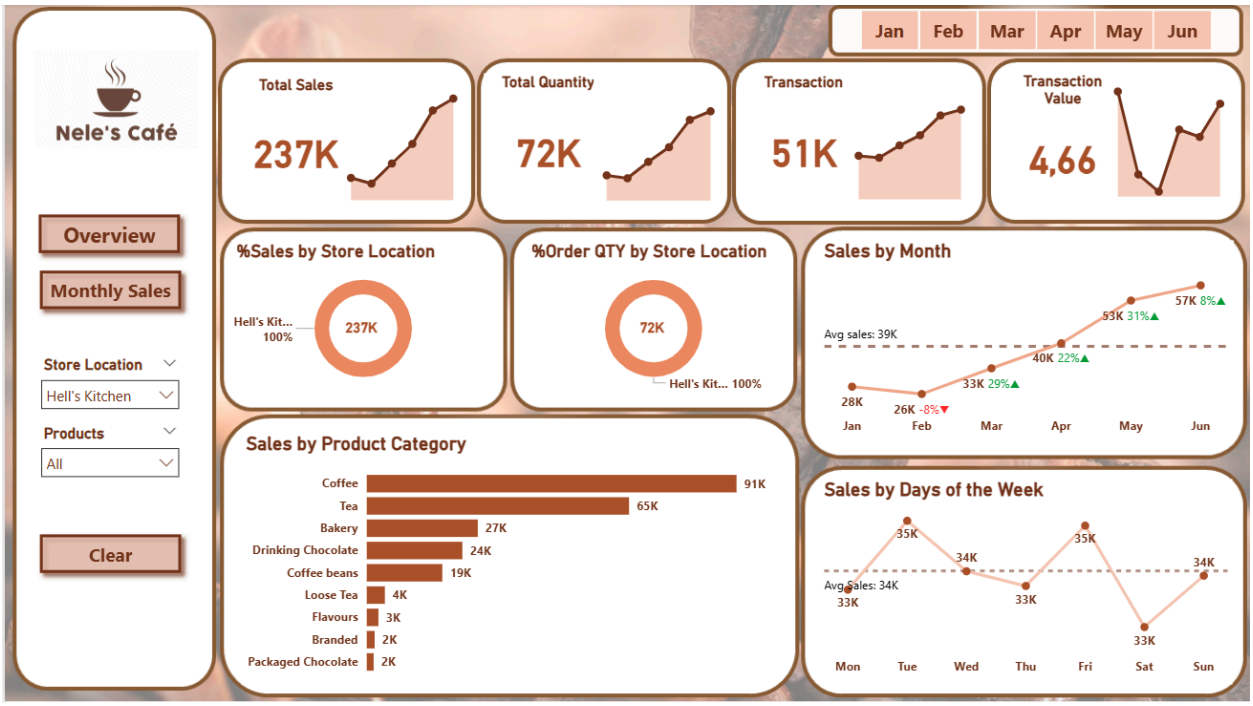
Sales are showing a strong and consistent upward trend. From February to June, total sales grew steadily from $76K to $166K. This indicates an ongoing growth for the business. The average transaction value during this period was $4.69.

Weekly sales are fairly stable, averaging just over $100K a day, there is a decline on Saturdays but a slight increase on Sundays.

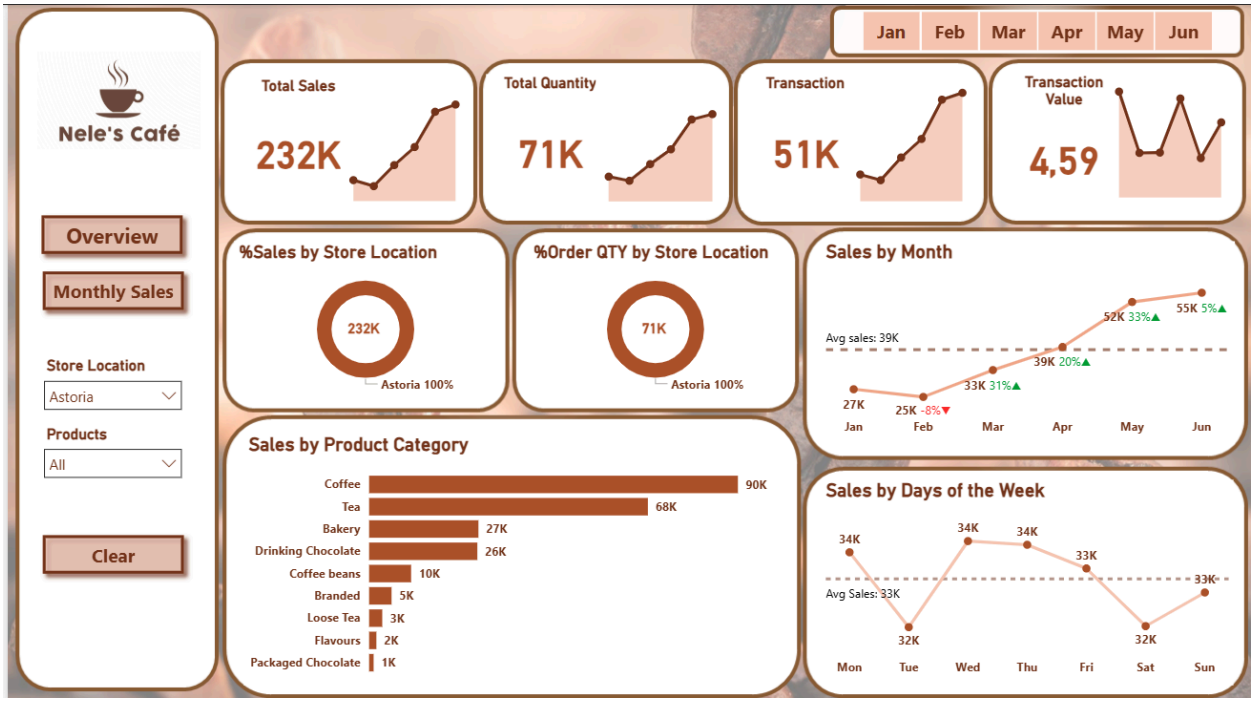
3.2 Which stores are performing best?

All three store locations are doing extremely well and contribute almost equally to total sales.

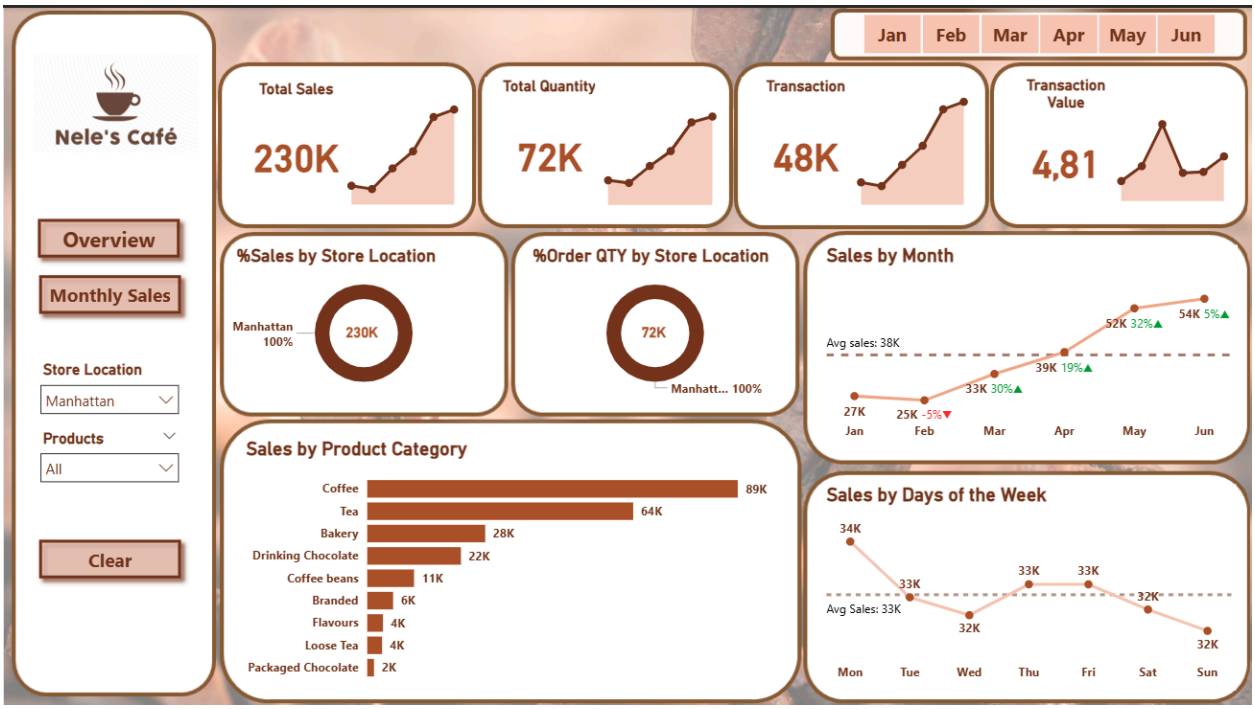
- **Hell's Kitchen** is the top store with $237K in total sales.



- **Astoria** is a close second, bringing in $232K in total sales.



- **Manhattan** generated $230K in total sales.



3.3 What products drive the most revenue?

The main revenue drivers for Nele's Café are **Coffee and Tea**.

- **Coffee:** This category leads in earnings, generating $270K in total sales.

- **Tea:** The second-highest category, with $196K in total sales.

Items like "Cappuccino Lg" and "Dark chocolate Lg" consistently rank as top sellers each month, showing strong customer demand for these products.

3.4 When do customers buy the most (time/day patterns)?

Customers demonstrate clear purchasing patterns throughout the day:

- **Morning Peak:** The busiest time for sales is in the morning, with a significant peak between 8 AM and 11 AM.
- **Afternoon Peak:** A smaller sales peak occurs in the late afternoon, between 4 PM and 5 PM.

3.5 Conclusion

After looking over the dashboard, the business seems to be healthy and growing. Sales are steadily rising, store performance is balanced, and customer buying patterns are clear and predictable. These findings show that the business is on a solid path and that there are many chances to build on this success.

3.6 Future Recommendations

Focus on Best-Selling Products a suggestion would be concentrating on top sellers like coffee, tea, Cappuccino Lg, and Dark Chocolate Lg. Creating special promotions for these items could encourage repeat purchases and increase sales further.

I observed that most sales happen during the morning and afternoon rushes. To make the most of this, I recommend scheduling staff and planning inventory around these times so customers receive quicker service and products are always available thus effectively preparing for peak hours.

There is a small decline in sales on Saturdays, which deserves attention. I recommend trying weekend-only promotions or limited-time offers to attract more customers and increase foot traffic.

Items like Packaged Chocolate consistently perform poorly. I suggest examining their profitability. If they aren’t providing value, it might make sense to cut back on their inventory or replace them with new products that better meet customer needs.
